Maternal Demographics:
Maternal population demographics such as maternal race/ethnicity and maternal age are important for developing targeted public health strategies to prevent adverse birth outcomes and address disparities in maternal and child health.

Maternal Race/Ethnicity
White mothers accounted for the highest proportion (40.4%) of births in the County in 2016, but Multi-race (70.5 per 1,000) and Hispanic (62.7) women had the highest fertility rates [Figure 1]. Fertility rates are the number of births per 1,000 women age 15-44 years.

Maternal Age
The majority (59.2%) of births in the County in 2016 was to mothers age 25-34 [Figure 2]. The age-specific birth rates in the County were lowest for older women and teens. The median age of mothers in the County increased from age 27 in 2007 to age 29 in 2016 [data not shown].

Teen Births
The total number of teen births for adolescents age 15 to 19 years declined from 2,122 in 2007 to 773 in 2016, a 63.6% drop [data not shown]. Similarly, the overall teen birth rate decreased 62.4% from 38.8 per 1,000 females age 15 to 19 in 2007 to 14.6 in 2016 [Figure 3]. Teen birth rates (age 15-19) declined for all racial/ethnic groups during this ten-year span. Hispanic teens consistently had the highest birth rates, until 2015 when the teen birth rate among Blacks surpassed that of Hispanics. Asian/Pacific Islanders (Asian/PIs) experienced the greatest decrease in teen birth rate (-76.0%), from 30.0 per 1,000 in 2007 to 7.2 in 2016.
Prenatal Behaviors:
The quality, quantity and timing of prenatal care influence pregnancy outcomes. The risk of low birth weight (LBW) is reduced for women who initiate care during the first trimester (first three months) of pregnancy. Substance use during pregnancy can also affect birth outcomes. Smoking during pregnancy doubles the risk of LBW and is a factor in 20 to 40 percent of LBW infants in the United States.
Source: Pregnancy Nutritional Surveillance System (PNSS)

Prenatal Care (PNC)
One Healthy People 2020 (HP2020) objective is for at least 77.9% of pregnant women to initiate PNC during the first trimester. Sacramento County met this objective every year in the past ten years, with the exception of 2007. The percent of County pregnant women initiating PNC in the first trimester was improved 8.5 percent from 76.7 percent in 2007 to 83.2 percent in 2016. In 2016 all racial/ethnic groups were above the HP2020 objective for PNC entry [Figure 5], except American Indian/Alaskan Native (AI/AN) women. Although AI/AN women had the lowest proportion (73.0%) of first trimester PNC compared to other racial/ethnic groups, these data should be interpreted with caution due to small numbers.

Tobacco Use
The percentage of pregnant women in Sacramento County who used tobacco during pregnancy (any trimester) decreased by 46.0% overall from 6.3% in 2007 to 3.4% 2016. Pregnant Asian/PI women had the largest decrease in tobacco use (-73.7%) compared to other racial/ethnic groups from 2007 to 2016. Black (5.6%) and White (4.1%) women were the most likely to use tobacco anytime during their pregnancy in 2016.
Delivery Characteristics:
Pregnancy risk profiles help inform delivery choices and delivery characteristics may influence outcomes. Planned home births are more likely to be among lower pregnancy risk profile births than hospital births. Cesarean birth is associated with higher maternal morbidity than vaginal birth. Medi-Cal delivery payment percentages may provide insight into issues around access to and utilization of services for the most vulnerable maternal populations.

Source: Centers for Disease Control and Prevention (CDC)

Delivery Location
The health systems that accounted for the highest proportion of deliveries in the County in 2016 were Sutter (36.3%) Kaiser (31.5%) and Dignity (23.2%) [Table 1]. Non-hospital births decreased 5.8 percent in 2016 compared to 2012, but still only accounted for less than one percent of total births. The total number of Sacramento County residents who delivered babies in Placer County facilities (i.e., Kaiser Roseville and Sutter Roseville) has grown by 12.8% from 2012 to 2016.

Delivery Type
Cesarean deliveries accounted for 28.6% of all deliveries in the County in 2016, a 3.4% increase compared to 2007 [data not shown]. The proportion of cesarean births among low-risk women (singleton, full-term birth with vertex presentation) met the HP2020 objective for women without a prior cesarean (first cesarean), but did not for women with a prior cesarean (repeat cesarean) for all years from 2007-2016 [Figure 7].

Medi-Cal Delivery Payment
The primary payment source for deliveries in 2016 was Medi-Cal for 47.0% [Figure 8]. The proportion of deliveries with Medi-Cal as primary payment source increased 7.3% from 43.8% in 2007 to 47.0% 2016. Black and Hispanic women had the highest proportion of deliveries with Medi-Cal payment, but Hispanic women were the only group without an increase in the proportion of Medi-Cal deliveries in the ten-year period. White and Asian/PI women had the lowest proportion of deliveries with Medi-Cal.

Figure 7. Percent of Cesarean Births among Low-Risk* Women with and without Prior Cesareans, Sacramento County, 2007-2016

*Low-risk women: full-term, singleton, and vertex presentation

Figure 8. Percent of Births with Medi-Cal Payment for Delivery by Select Race/Ethnicity, Sacramento County, 2007-2016
Birth Outcomes:

Important growth and development occurs throughout pregnancy. Low birth weight (less than 2,500 grams or 5.5 pounds) is the risk factor most closely associated with infant death. Preterm birth is when a baby is born too early (before 37 weeks of pregnancy). The earlier a baby is born, the higher the risk of death or serious disability.

Source: Centers for Disease Control and Prevention (CDC)

Low Birth Weight (LBW)
Sacramento County met the HP2020 Objective of keeping low birth weight to less than 7.8% of all live births for all years from 2007 to 2016 [Figure 9].

In 2016, births to White and Hispanic women met the HP2020 LBW Objective. Births to Asian/PI and Black women did not meet the Objective. Black women had the highest percentage of low birth weight babies, 34.6% higher than the HP2020 Objective [Figure 11].

Preterm Birth (PTB)
The percent of Sacramento County births born too early decreased by 8.9% from 10.1% in 2007 to 9.2% in 2016 [Figure 10]. However, the County only met the HP2020 Objective for PTB for six individual years in this ten-year period. The HP2020 Objective is for 11.4% or less of all live births to be born preterm.

In 2016, all selected race/ethnicity groups had met the HP2020 Objective for PTB [Figure 11]. The preterm birth percentage for babies born to Black mothers dropped by 17.7% from 13.0% in 2007 to 10.7% in 2016 [data not shown].
